Bold Recipe Card Template Installation Instructions

Thanks for downloading the Bold recipe card template! There are a few more moving parts to this template, so we're including some extra instructions.

First, to use this template you must have FTP access to your website so that you can add all the files to your theme folder. You cannot use this template with just the WordPress Customizer.

For instructions on installing with FTP, see our support doc here: http://support.wptasty.com/customizing-tasty-recipes/how-do-i-apply-provided-css-styles-to-tasty-recipes

When you unzip the file included with this download, there will be a folder called `bold-recipe-card`. This folder contains three things:
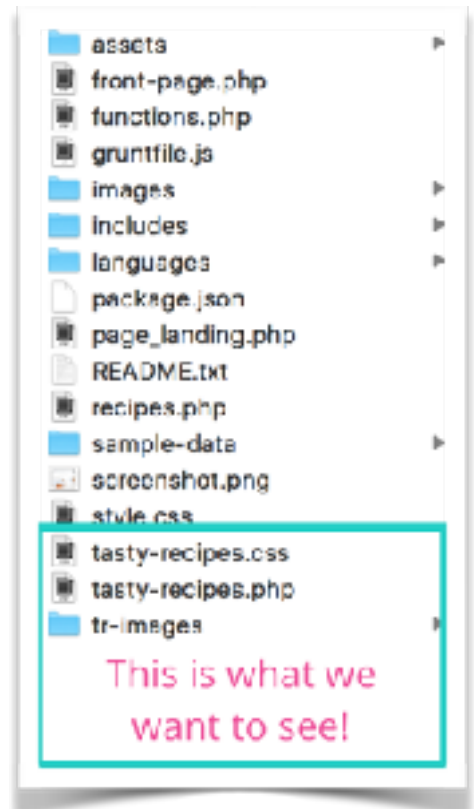

- a `tasty-recipes.css` file
- a `tasty-recipes.php` file
- a `tr-images/` folder with a number of images

Transfer all of these things to your website's theme folder, *including* the folder containing the images. Do not place the images individually in your theme folder.

See example over to the right —>

Using the Pin Button

The "Pin Recipe" button included in the recipe card will only work if you have included `pinit.js` on your page. You can get the script for pinit.js on the Pinterest Save Button page here: https://developers.pinterest.com/docs/widgets/save/?

You *only* need the script that is listed on the page - you don't need the button HTML. The `pinit.js` script goes in your theme header. If you already had a Save button on your site then you likely already have it installed. If not then you will need to add the script to your site. Because each theme is different this isn't something we can help with - however, WP Beginner has a <u>tutorial</u> that will work for most people: <u>http://www.wpbeginner.com/plugins/how-to-add-header-and-footer-code-in-wordpress/</u>

Using the optional Instagram footer

If you want to display the optional Instagram footer, you need to edit the `tasty-recipes.php` file before uploading.

Open the file in a text editor and take a look at lines 2 and 3 - each has comments describing what to do.

**Note: If you are using a Mac, the default TextEdit program may change the straight quotes to curly quotes and break the Instagram footer functionality. We recommend using a program such as <u>Sublime Text</u>, or <u>turning off Smart Quotes on your Mac</u>.

Line 2 is where you will put your Instagram handle. Place your Instagram handle in between the quotes after the equal sign. Do not include an @ symbol. As an example, the Pinch of Yum Instagram handle is "`pinchofyum`". The resulting value on line 2 would be:

```
$instagram_handle = 'pinchofyum';
```

Line 3 is where you put your site-specific hashtag. This is not anything assigned by Instagram - it is something that you have decided you want your readers to tag when they make one of your recipes. Place your Instagram handle in between the quotes after the equal sign on line 3. Do not include a # symbol. The Pinch of Yum hashtag is "`pinchofyum`". The resulting value on line 3 would be:

```
$instagram_hashtag = 'pinchofyum';
```

Please be sure to keep the surrounding quotes around the values, as well as the semi-colons that end each line. If you delete these, the file will not work.

Save the file, then upload it to your theme folder (along with the other files if you haven't already). View a recipe to make sure everything looks good; you may need to clear your cache for the changes to appear.
